HME modules are versatile, precise and stable analog controlled high voltage power supplies with multiple options. The HME series covers output voltages of up to 30kV in a compact metal box. The maximum output power is 150W. The HV output is brought out via an HV cable. The control voltages and analog I/O are connected via a D-Sub 9 connector. The control of output voltage and current is achieved by means of control voltages or potentiometers (internal reference voltage). Remote ON and INHIBIT inputs, as well as output voltage and output current monitoring outputs, are provided.

The HME modules can be equipped as capacitor charger with very low output voltage overshoot (option C). They also can be protected against high-frequency arcs (option A).

For medium quantities the devices can be equipped with a Safety-Interlock loop.

The patented resonant converter technology and the metal box shielding guarantee high efficiency and low EMI.

The HME modules can be used as standalone DC/DC converters or combined into THQ series multichannel AC/DC HV power supplies.
